6.	PCIe Reference Design – DDR3.....	22

PCI Express is commonly used in consumer, server, and industrial applications, to link motherboard-mounted peripherals. From this demonstration, it will show how the PC Windows and FPGA communicate with each other through the PCI Express interface. IP_Compiler for PCI Express and Modular SGDMA are used in this demonstration. For detail about this Modular SGDMA, please refer to Intel document http://www.alterawiki.com/wiki/File:MSGDMA_Docs.zip.

1. PCI Express System Infrastructure

Figure 1 shows the infrastructure of the PCI Express System in this demonstration. It consists of two primary components: FPGA System and PC System. The FPGA System is developed based on IP_Compiler for PCI Express and Modular SGDMA. The application software on the PC side is developed by Terasic based on Intel's PCIe kernel mode driver.

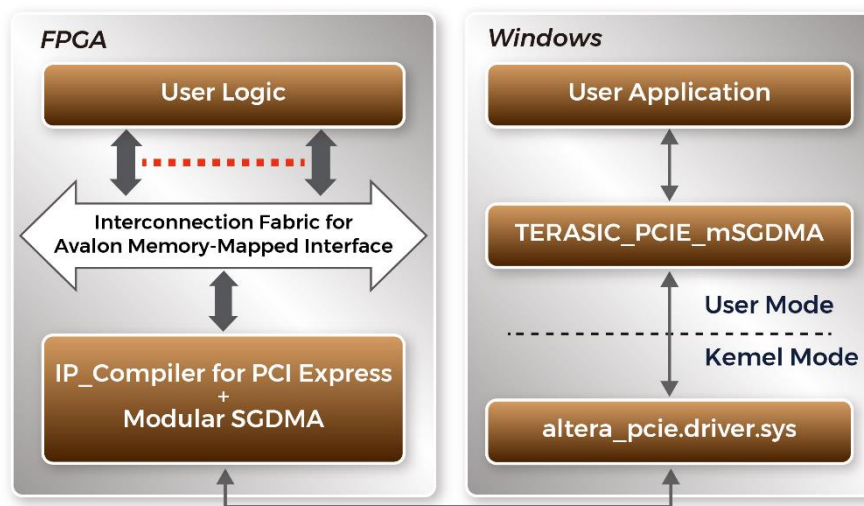

Figure 1 Infrastructure of PCI Express System

2. PC PCI Express Software SDK

The FPGA System CD contains a PC Windows based SDK to allow users to develop their 64-bit software application on 64-bits Windows 7 or Window XP. The SDK is located in the “CDROM \demonstrations\PCIe_SW_KIT\Windows” folder which includes:

- PCI Express Driver
- PCI Express Library
- PCI Express Examples

The kernel mode driver assumes the PCIe vender ID (VID) is 0x1172 and the device ID (DID) is 0xE001. If different VID and DID are used in the design, users need to modify the PCIe vender ID (VID) and device ID (DID) in the driver INF file accordingly.

The PCI Express Library is implemented as a single DLL named TERASIC_PCIE_mSGDMA.DLL.

This file is a 64-bit DLL. With the DLL is exported to the software API, users can easily communicate with the FPGA. The library provides the following functions:

- Basic data read and write
- Data read and write by DMA

For high performance data transmission, Intel Modular SGDMA is required as the read and write operations are specified under the hardware design on the FPGA.

3. PCI Express Software Stack

Figure 2 shows the software stack for the PCI Express application software on 64-bit Windows. The PCI Express driver incorporated in the DLL library is called Terasic_PCIE_mSGDMA.dll. Users can develop their applications based on this DLL. The altera_pcie_win_driver.sys kernel driver is provided by Intel.

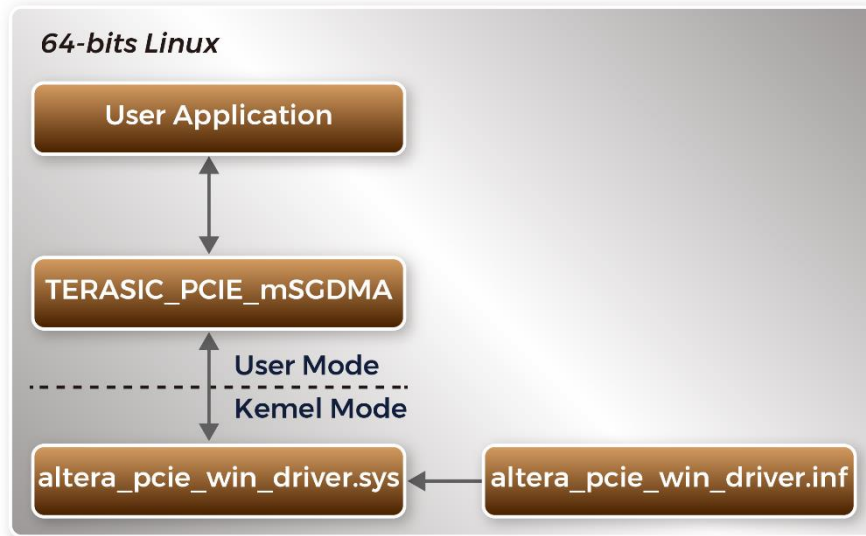

Figure 2 PCI Express Software Stack

■ Install PCI Express Driver on Windows

The PCIe driver is located in the folder:

“CDROM\Demonstrations\PCIe_SW_KIT\Windows\PCIe_Driver “

The folder includes the following four files:

- Altera_pcie_win_driver.cat
- Altera_pcie_win_driver.inf
- Altera_pcie_win_driver.sys
- WdfCoinstaller01011.dll

To install the PCI Express driver, please execute the steps below:

1. Make sure TR4 and PC are both powered off.
2. Plug the PCIe adapter card 3 (PCA3) into PCIe slot on the PC motherboard.
Use the PCIe cable to connect to the TR4 PCIE0 connector and PCIe adapter card

3. Power on your TR4 board and host PC
4. Make sure Intel Programmer and USB-Blaster II driver are installed
5. Execute test.bat in "CDROM\Demonstrations\PCIe_Fundamental\demo_batch" to configure the FPGA
6. Restart Windows operation system
7. Click Control Panel menu from Windows Start menu. Click Hardware and Sound item before clicking the Device Manager to launch the Device Manager dialog. There will be a PCI Device item in the dialog, as shown in **Figure 3**. Move the mouse cursor to the PCI Device item and right click it to select the Update Driver Software... item.

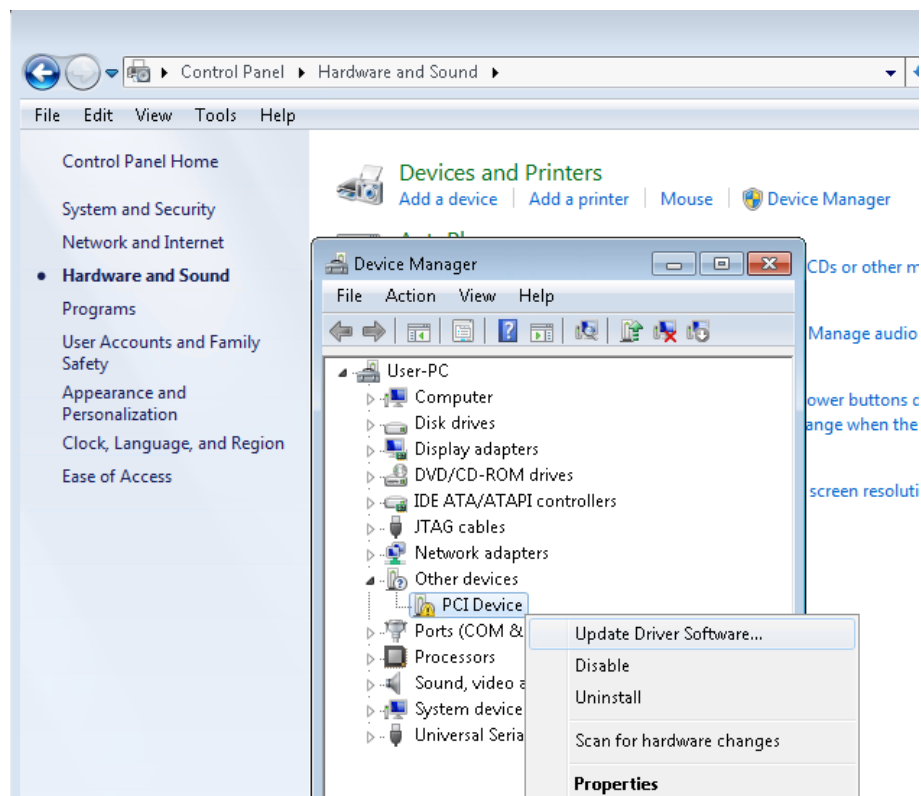

Figure 3 Screenshot of launching Update Driver Software... dialog

8. In the **How do you want to search for driver software** dialog, click **Browse my computer for driver software** item, as shown in **Figure 4**.

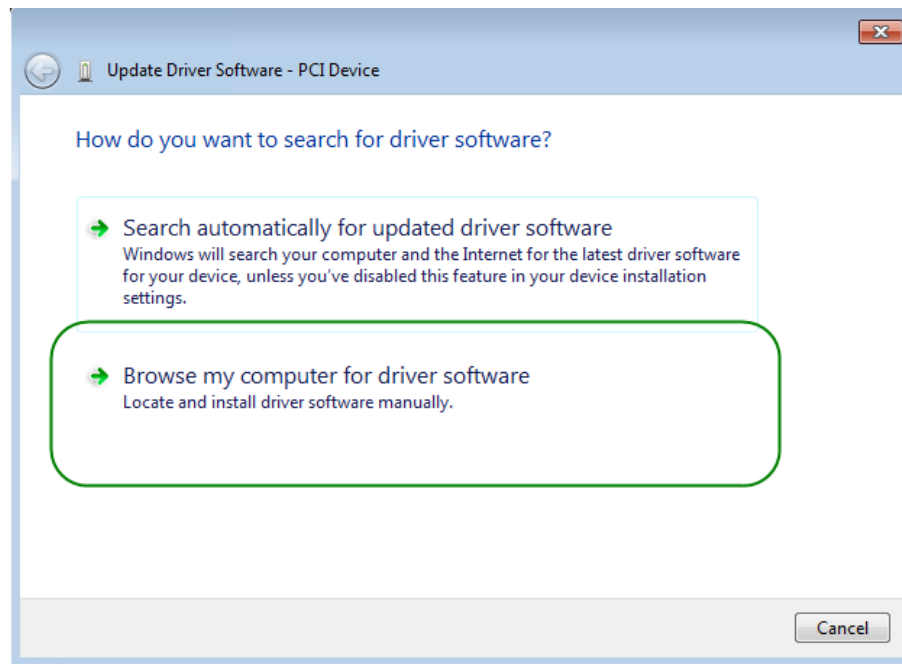

Figure 4 Dialog of Browse my computer for driver software

9. In the **Browse for driver software on your computer** dialog, click the **Browse** button to specify the folder where altera_pcie_din_driver.inf is located, as shown in **Figure 5**. Click the **Next** button.

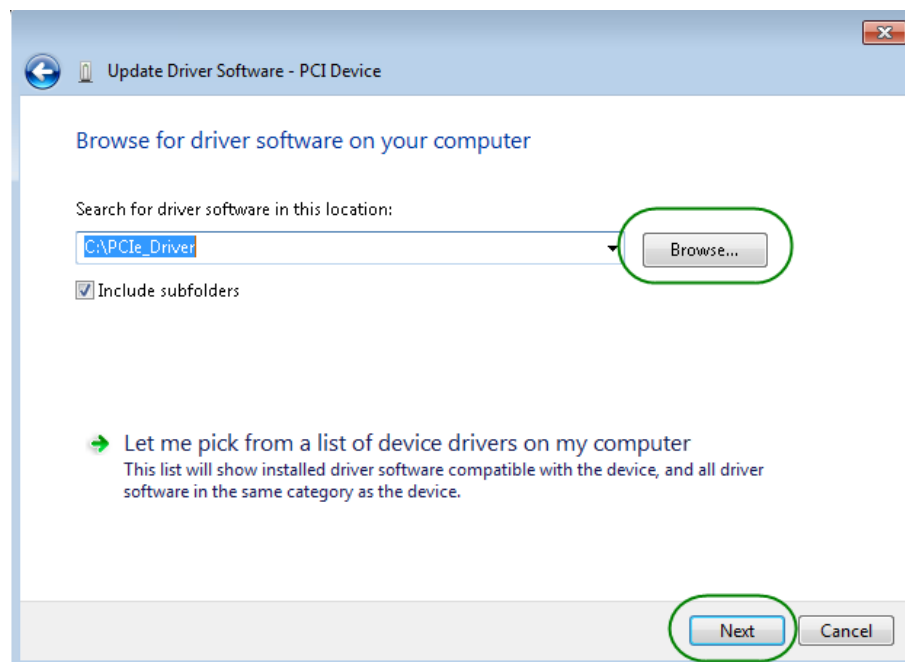

Figure 5 Browse for driver software on your computer

10. When the **Windows Security** dialog appears, as shown **Figure 6** click the **Install** button.

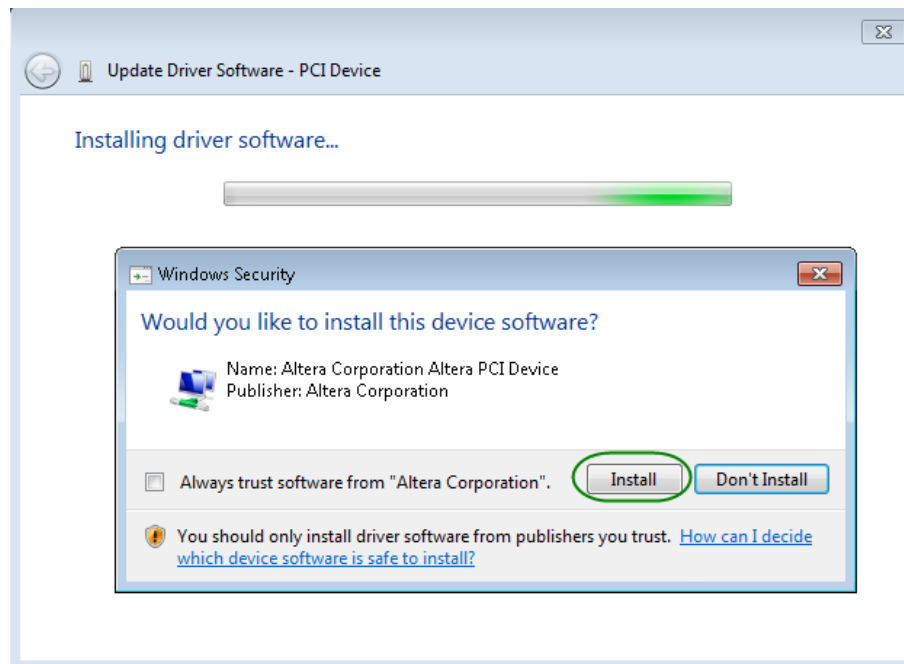

Figure 6 Click Install in the dialog of Windows Security

11. When the driver is installed successfully, the successfully dialog will appears, as shown in **Figure 7**. Click the **Close** button.

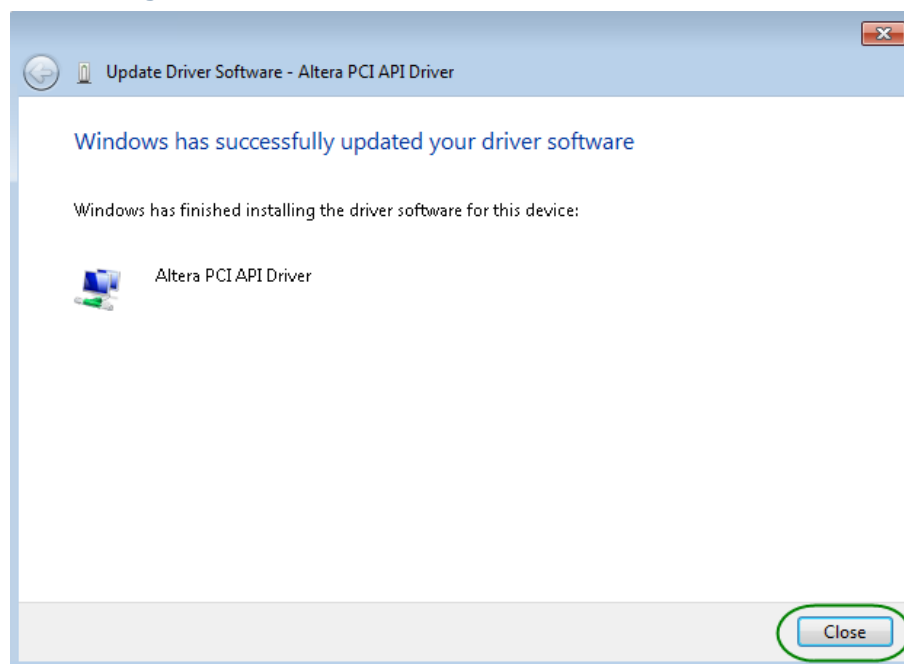

Figure 7 Click Close when the installation of PCI Driver is complete

12. Once the driver is successfully installed, users can see the **Altera PCI API Driver** under the device manager window, as shown in **Figure 8**.

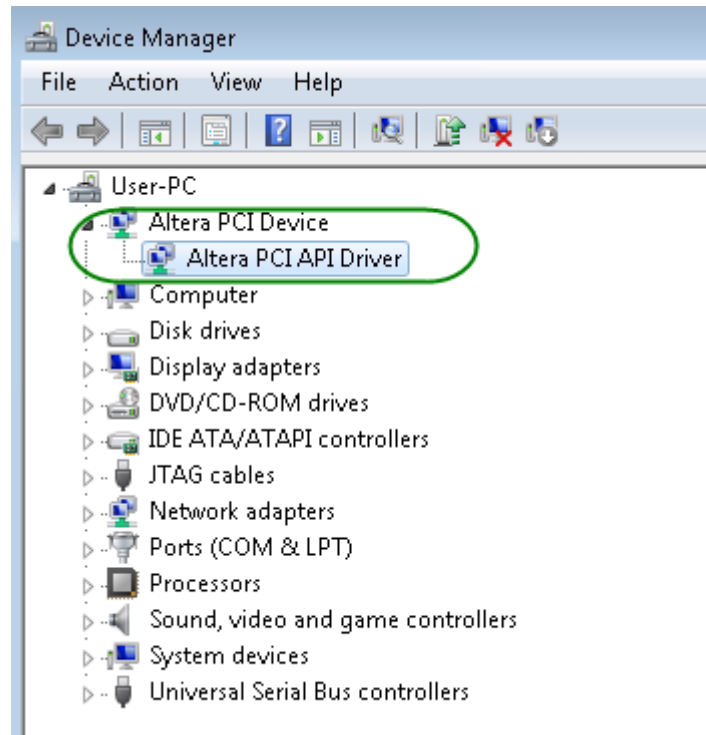

Figure 8 Altera PCI API Driver in Device Manager

■ Create a Software Application

All the files needed to create a PCIe software application are located in the directory C:\CDROM\demonstration\PCIe_SW_KIT\Windows\PCIe_Library. It includes the following files:

- Terasic_PCIE_mSGDMA.h
- Terasic_PCIE_mSGDMA.DLL (64-bit DLL)

Below lists the procedures to use the SDK files in users' C/C++ project :

1. Create a 64-bit C/C++ project.
2. Include Terasic_PCIE_mSGDMA.h in the C/C++ project.
3. Copy Terasic_PCIE_mSGDMA.DLL to the folder where the project.exe is located.
4. Dynamically load Terasic_PCIE_mSGDMA.DLL in C/C++ program. To load the DLL, please refer to the PCIe fundamental example below.
5. Call the SDK API to implement the desired application.

Users can easily communicate with the FPGA through the PCIe bus through the Terasic_PCIE_mSGDMA.DLL API. The details of API are described below:

4. PCI Express Library API

Below shows the exported API in the Terasic_PCIE_MSGDMA.DLL. The API prototype is defined in the Terasic_PCIE_MSGDMA.h.

Note: the Linux library terasic_pcie_qsys.so also use the same API and header file.

■ PCIE_Open

Function:
Open a specified PCIe card with vendor ID, device ID, and matched card index.
Prototype:
<pre>PCIE_HANDLE PCIE_Open(uint8_t wVendorID, uint8_t wDeviceID, uint8_t wCardIndex);</pre>
Parameters:
<p>wVendorID:</p> <p>Specify the desired vendor ID. A zero value means to ignore the vendor ID.</p> <p>wDeviceID:</p> <p>Specify the desired device ID. A zero value means to ignore the device ID.</p> <p>wCardIndex:</p> <p>Specify the matched card index, a zero based index, based on the matched vendor ID and deviceID.</p>
Return Value:
<p>Return a handle to presents specified PCIe card. A positive value is return if the PCIe card is opened successfully. A value zero means failed to connect the target PCIe card.</p> <p>This handle value is used as a parameter for other functions, e.g. PCIE_Read32.</p> <p>Users need to call PCIE_Close to release handle once the handle is no more used.</p>

■ PCIE_Close

Function:
Close a handle associated to the PCIe card.
Prototype:
<pre>void PCIE_Close(PCIE_HANDLE hPCIE);</pre>
Parameters:

hPCIE: A PCIe handle return by PCIE_Open function.
Return Value: None.

■ PCIE_Read32

Function: Read a 32-bit data from the FPGA board.
Prototype: <pre>bool PCIE_Read32(PCIE_HANDLE hPCIE, PCIE_BAR PcieBar, PCIE_ADDRESS PcieAddress, uint32_t *pdwData);</pre>
Parameters: hPCIE: A PCIe handle return by PCIE_Open function. PcieBar: Specify the target BAR. PcieAddress: Specify the target address in FPGA. pdwData: A buffer to retrieve the 32-bit data.
Return Value: Return true if read data is successful; otherwise false is returned.

■ PCIE_Write32

Function: Write a 32-bit data to the FPGA Board.
Prototype: <pre>bool PCIE_Write32(PCIE_HANDLE hPCIE, PCIE_BAR PcieBar, PCIE_ADDRESS PcieAddress, uint32_t dwData);</pre>
Parameters: hPCIE: A PCIe handle return by PCIE_Open function.

<p>PcieBar:</p> <p>Specify the target BAR.</p> <p>PcieAddress:</p> <p>Specify the target address in FPGA.</p> <p>dwData:</p> <p>Specify a 32-bit data which will be written to FPGA board.</p>
<p>Return Value:</p> <p>Return true if write data is successful; otherwise false is returned.</p>

■ PCIE_Write8

<p>Function:</p> <p>Write an 8-bit data to the FPGA Board.</p>
<p>Prototype:</p> <pre>bool PCIE_Write8(PCIE_HANDLE hPCIE, PCIE_BAR PcieBar, PCIE_ADDRESS PcieAddress, uint8_t Byte);</pre>
<p>Parameters:</p> <p>hPCIE:</p> <p>A PCIe handle return by PCIE_Open function.</p> <p>PcieBar:</p> <p>Specify the target BAR.</p> <p>PcieAddress:</p> <p>Specify the target address in FPGA.</p> <p>Byte:</p> <p>Specify an 8-bit data which will be written to FPGA board.</p>
<p>Return Value:</p> <p>Return true if write data is successful; otherwise false is returned.</p>

■ PCIE_DmaRead

<p>Function:</p> <p>Read data from the memory-mapped memory of FPGA board in DMA.</p> <p>Maximal read size is (4GB-1) bytes.</p>
<p>Prototype:</p> <pre>bool PCIE_DmaRead(</pre>

```
PCIE_HANDLE hPCIE,
PCIE_LOCAL_ADDRESS LocalAddress,
void *pBuffer,
uint32_t dwBufSize
);
```

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

LocalAddress:

Specify the target memory-mapped address in FPGA.

pBuffer:

A pointer to a memory buffer to retrieved the data from FPGA. The size of buffer should be equal or larger the dwBufSize.

dwBufSize:

Specify the byte number of data retrieved from FPGA.

Return Value:

Return **true** if read data is successful; otherwise **false** is returned.

■ PCIE_DmaWrite

Function:

Write data to the memory-mapped memory of FPGA board in DMA.

Prototype:

```
bool PCIE_DmaWrite(
    PCIE_HANDLE hPCIE,
    PCIE_LOCAL_ADDRESS LocalAddress,
    void *pData,
    uint32_t dwDataSize
);
```

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

LocalAddress:

Specify the target memory mapped address in FPGA.

pData:

A pointer to a memory buffer to store the data which will be written to FPGA.

dwDataSize:

Specify the byte number of data which will be written to FPGA.

Return Value:

Return **true** if write data is successful; otherwise **false** is returned.

■ PCIE_ConfigRead32

Function:

Read PCIe Configuration Table. Read a 32-bit data by given a byte offset.

Prototype:

```
bool PCIE_ConfigRead32 (
    PCIE_HANDLE hPCIE,
    uint32_t Offset,
    uint32_t *pdwData
);
```

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

Offset:

Specify the target byte of offset in PCIe configuration table.

pdwData:

A 4-bytes buffer to retrieve the 32-bit data.

Return Value:

Return **true** if read data is successful; otherwise **false** is returned.

■ PCIE_ConfigRead8

Function:

Read PCIe Configuration Table. Read a 8-bit data by given a byte offset.

Prototype:

```
bool PCIE_ConfigRead8 (
    PCIE_HANDLE hPCIE,
    uint32_t Offset,
    uint8_t *pByte
);
```

Parameters:

hPCIE:

A PCIe handle return by PCIE_Open function.

Offset:

Specify the target byte of offset in PCIe configuration table.

pByte:

A 1-bytes buffer to retrieve the 8-bit data.

Return Value:

Return **true** if read data is successful; otherwise **false** is returned.

5. PCIe Reference Design - Fundamental

The application reference design shows how to implement fundamental control and data transfer in DMA. In the design, basic I/O is used to control the BUTTON and LED on the FPGA board. High-speed data transfer is performed by DMA.

■ Demonstration Files Location

The demo file is located in the batch folder:

CDROM\demonstrations\TR4_x30\PCIe_Fundamental\demo_batch

The folder includes following files:

- FPGA Configuration File: PCIe_Fundamental.sof
- Download Batch file: test.bat
- Windows Application Software folder : windows_app, includes
 - ✧ PCIE_FUNDAMENTAL.exe
 - ✧ TERASIC_PCIE_mSGDMA.dll

■ Demonstration Setup

1. Use the PCIe cable to connect to the TR4 PCIE0 connector and PCIe adapter card 3 (PCA3) as shown in **Figure 9**.

Figure 9 FPGA board connect to PC

2. Configure FPGA with PCIe_Fundamental.sof by executing the test.bat.

3. Install PCIe driver if necessary. The driver is located in the folder:
CDROM\Demonstration\PCIe_SW_KIT\Windows\PCIe_Driver.
4. Restart Windows
5. Make sure the Windows has detected the FPGA Board by checking the Windows Control panel as shown in **Figure 10**.

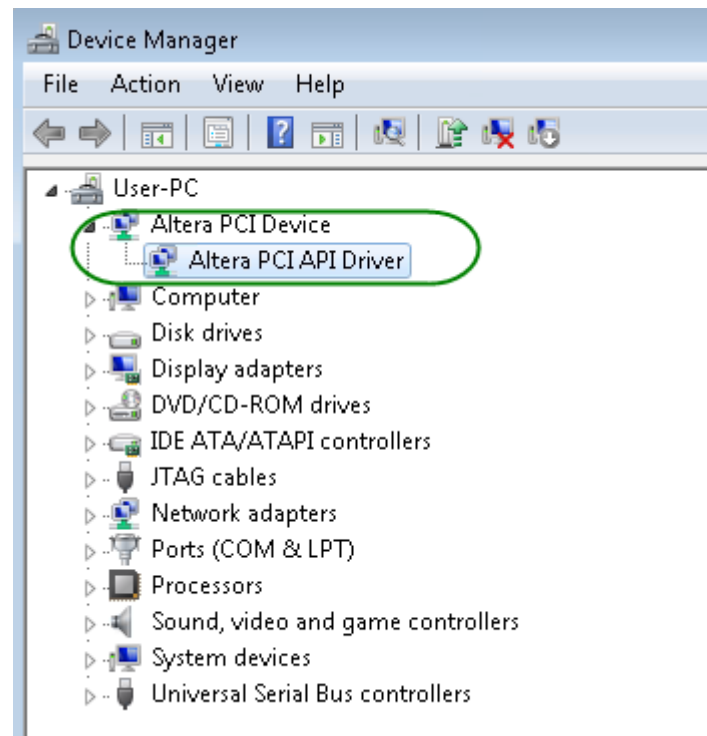

Figure 10 Screenshot for PCIe Driver

6. Goto windows_app folder, execute PCIE_FUNDMENTAL.exe. A menu will appear as shown in **Figure 11**.

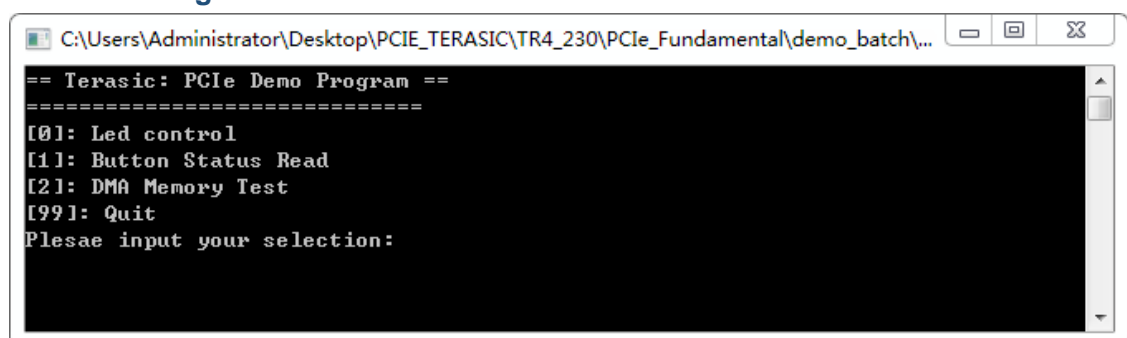

Figure 11 Screenshot of Program Menu

7. Type 0 followed by a ENTERY key to select Led Control item, then input 15(hex 0x0f) will make all led on as shown in **Figure 12**. If input 0(hex 0x00), all led will be turn off.

■ Development Tools

- Quartus Prime 17.0 Standard Edition
- Visual C++ 2012

■ Demonstration Source Code Location

- Quartus Project: Demonstrations\TR4_x30\PCie_Fundamental
- C++ Project: Demonstrations\PCie_SW_KIT\Windows\PCIE_FUNDAMENTAL

■ FPGA Application Design

Figure 15 shows the system block diagram in the FPGA system. In the Qsys, PIO controller is used to control the LED and monitor the Button Status, and the On-Chip memory is used for performing DMA testing. The PIO controllers and the On-Chip memory are connected to the PCI Express Hard IP controller through the Memory-Mapped Interface.

Figure 15 Hardware block diagram of the PCIe reference design

■ Windows Based Application Software Design

The application software project is built by Visual C++ 2012. The project includes the following major files:

Name	Description
PCIE_FUNDAMENTAL.cpp	Main program
PCIE.c	Implement dynamically load for TERAISC_PCIE_mSGDMA.DLL
PCIE.h	
TERASIC_PCIE_mSGDMA.h	SDK library file, defines constant and data structure

The main program PCIE_FUNDAMENTAL.cpp includes the header file "PCIE.h" and defines the controller address according to the FPGA design.

```

#include "PCIE.h"

#define DEMO_PCIE_USER_BAR          PCIE_BAR4
#define DEMO_PCIE_IO_LED_ADDR       0x4000010
#define DEMO_PCIE_IO_BUTTON_ADDR    0x4000020
#define DEMO_PCIE_MEM_ADDR          0x07000000

#define MEM_SIZE                     (512*1024) //512KB

```

The base address of BUTTON and LED controllers are 0x4000010 and 0x4000020 based on PCIE_BAR4, in respectively. The on-chip memory base address is

0x07000000 relative to the DMA controller.

Before accessing the FPGA through PCI Express, the application first calls `PCIE_Load` to dynamically load the `TERASIC_PCIE_mSGDMA.DLL`. Then, it call `PCIE_Open` to open the PCI Express driver. The constant `DEFAULT_PCIE_VID` and `DEFAULT_PCIE_DID` used in `PCIE_Open` are defined in `TERASIC_PCIE_mSGDMA.h`. If developer change the Vender ID and Device ID and PCI Express IP, they also need to change the ID value define in `TERASIC_PCIE_mSGDMA.h`. If the return value of `PCIE_Open` is zero, it means the driver cannot be accessed successfully. In this case, please make sure:

- The FPGA is configured with the associated bit-stream file and the host is rebooted.
- The PCI express driver is loaded successfully.

The LED control is implemented by calling `PCIE_Write32` API, as shown below:

```
bPass = PCIE_Write32(hPCIE, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_LED_ADDR, (uint32_t) Mask);
```

The button status query is implemented by calling the **`PCIE_Read32`** API, as shown below:

```
PCIE_Read32(hPCIE, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_BUTTON_ADDR, &Status);
```

The memory-mapped memory read and write test is implemented by **`PCIE_DmaWrite`** and **`PCIE_DmaRead`** API, as shown below:

```
PCIE_DmaWrite(hPCIE, LocalAddr, pWrite, nTestSize);  
PCIE_DmaRead(hPCIE, LocalAddr, pRead, nTestSize);
```

6. PCIe Reference Design – DDR3

The application reference design shows how to add DDR3 Memory Controllers for DDR3 SODIMM into the PCIe Quartus project based on the PCIe_Fundamental Quartus project and perform 1GB data DMA for both SODIMM. Also, this demo shows how to call “PCIE_ConfigRead32” API to check PCIe link status.

■ Demonstration Files Location

The demo file is located in the batch folder:

CDROM\demonstrations\TR4_x30\PCIe_DDR3\demo_batch

The folder includes following files:

- FPGA Configuration File: PCIe_DDR3.sof
- Download Batch file: test.bat
- Windows Application Software folder : windows_app, includes
 - ✧ PCIE_DDR3.exe
 - ✧ TERASIC_PCIE_mSGDMA.dll

■ Demonstration Setup

1. Install both DDR3 1600 1GB SODIMM on the FPGA board.
2. Install the FPGA board on your PC.
3. Configure FPGA with PCIe_DDR3.sof by executing the test.bat.
4. Install PCIe driver if necessary.
5. Restart Windows
6. Make sure the Windows has detected the FPGA Board by checking the Windows Control panel.
7. Goto windows_app folder, execute PCIE_DDR3.exe. A menu will appear as shown in **Figure 16**.

■ Development Tools

- Quartus Prime 17.0 Standard Edition
- Visual C++ 2012

■ Demonstration Source Code Location

- Quartus Project: Demonstrations\TR4_x30\PCIE_DDR3
- Visual C++ Project: Demonstrations\PCle_SW_KIT\Windows\PCIE_DDR3

■ FPGA Application Design

Figure 20 shows the system block diagram in the FPGA system. In the Qsys, PIO controller is used to control the LED and monitor the Button Status, and the On-Chip memory is used for performing DMA testing. The PIO controllers and the On-Chip memory are connected to the PCI Express Hard IP controller through the Memory-Mapped Interface.

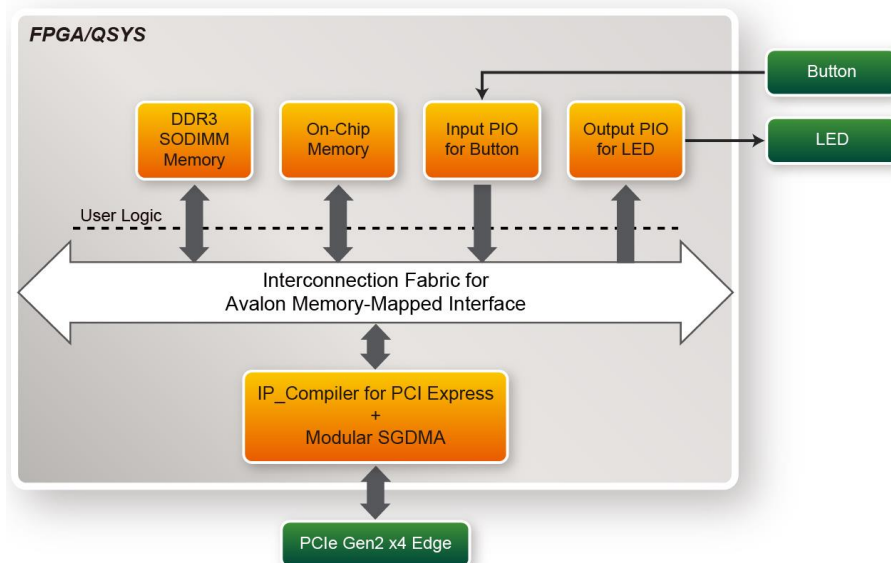

Figure 20 Hardware block diagram of the PCIe_DDR3 reference design

■ Windows Based Application Software Design

The application software project is built by Visual C++ 2012. The project includes the following major files:

Name	Description
PCIE_DDR3.cpp	Main program
PCIE.c	Implement dynamically load for TERAISC_PCIE_mSGDMA.DLL
PCIE.h	
TERASIC_PCIE_mSGDMA.h	SDK library file, defines constant and data structure

The main program PCIE_DDR3.cpp includes the header file "PCIE.h" and defines the controller address according to the FPGA design.

```
#define DEMO_PCIE_USER_BAR      PCIE_BAR4
#define DEMO_PCIE_IO_LED_ADDR   0x4000010
#define DEMO_PCIE_IO_BUTTON_ADDR 0x4000020
#define DEMO_PCIE_ONCHIP_MEM_ADDR 0x07000000
#define DEMO_PCIE_DDR3_MEM_ADDR 0x40000000

#define ONCHIP_MEM_TEST_SIZE    (512*1024) //512KB
#define DDR3_MEM_TEST_SIZE      (1*1024*1024*1024) //1GB
#define DMA_CHUNK_SIZE          (1*1024*1024*1024) //1GB
```

The base address of BUTTON and LED controllers are 0x4000010 and 0x4000020 based on PCIE_BAR4, in respectively. The on-chip memory base address is

0x07000000 relative to the DMA controller. The above definition is the same as those in PCIE_Fundamental demo.

Before accessing the FPGA through PCI Express, the application first calls PCIE_Load to dynamically load the Terasic_PCIE_mSGDMA.DLL. Then, it call PCIE_Open to open the PCI Express driver. The constant DEFAULT_PCIE_VID and DEFAULT_PCIE_DID used in PCIE_Open are defined in Terasic_PCIE_mSGDMA.h. If developer change the Vendor ID and Device ID and PCI Express IP, they also need to change the ID value define in Terasic_PCIE_mSGDMA.h. If the return value of PCIE_Open is zero, it means the driver cannot be accessed successfully. In this case, please make sure:

- The FPGA is configured with the associated bit-stream file and the host is rebooted.
- The PCI express driver is loaded successfully.

The LED control is implemented by calling PCIE_Write32 API, as shown below:

```
bPass = PCIE_Write32(hPCIE, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_LED_ADDR, (uint32_t) Mask);
```

The button status query is implemented by calling the **PCIE_Read32** API, as shown below:

```
PCIE_Read32(hPCIE, DEMO_PCIE_USER_BAR, DEMO_PCIE_IO_BUTTON_ADDR, &Status);
```

The memory-mapped memory read and write test is implemented by **PCIE_DmaWrite** and **PCIE_DmaRead** API, as shown below:

```
PCIE_DmaWrite(hPCIE, LocalAddr, pWrite, nTestSize);  
PCIE_DmaRead(hPCIE, LocalAddr, pRead, nTestSize);
```

The pcie link information is implemented by PCIE_ConfigRead32 API, as shown below:

```
// read config - link status
if (PCIE_ConfigRead32(hPCIE, 0x90, &Data32)){
    switch((Data32 >> 16) & 0x0F){
        case 1:
            printf("Current Link Speed is Gen1\r\n");
            break;
        case 2:
            printf("Current Link Speed is Gen2\r\n");
            break;
        case 3:
            printf("Current Link Speed is Gen3\r\n");
            break;
        default:
